Overview of the Chapters Oct 13, 2009

1. Introduction to the (Electrolytic) Neural System 1
Presentation of a new framework for interpretation of the neural system. A focus on the electrical mode of signaling answers questions not answerable based on a chemical signaling assumption. The dichotomy between the holistic and reductionist approach to analysis is reviewed and an extended Neuron Doctrine is presented.
2. The neuron as an electrolytic element 29
After reviewing the necessary physical chemistry, the neuron is developed from a reductionist view (from bottom to top). The large variety of neurons is reviewed along with their varied features.
3. The chemical environment & electrolytic power supply (to the neural system) 69
The complex chemical environment surrounding the neurons is reviewed along with the electrostenolytic mechanisms powering the neurons. The result is a new electrolytic paradigm replacing the chemical theory of the neuron.
4. The architecture of the neural system 113
The gross architecture of the neural system is explored including its division into 7 functional stages and a variety of concurrent operating modes.
5. The morphology of the neural system 113
6. The electrophysiology of the neural system 113
7. Modeling of Neural Systems 113
8. Stage 1 Signal Generation & Stage 2 Signal Processing 205
The first presentation describing the detailed performance of both the inner and outer hair cells in their respective sensory roles, including their dynamic roles.

The architecture and both signal convergence and signal divergence encountered in the analog signaling portion of the peripheral neural system of hearing.
9. Stage 3 Signal Projection 297
The techniques employed to convert analog signals into action potential pulse streams for efficient signal projection and the special histographic techniques required to understand the encoding/decoding mechanisms are presented. The differences between analog signal conduction and phasic signal propagation are discussed.
10. Stages 4 Signal Manipulation in the CNS (information extraction & saliency map) ... 357
The first description of the mechanisms and methods used to extract information from the signal streams presented to the CNS, along with the first appearance of "attention" in the

neural system is developed. [xxx old chap 11]	
11. Stages 5 Cognition [xxx old 12]	357
XXX A functional description of the mechanisms and methods employed in the prefrontal lobe of the human brain.	
10. Stages 6 & 7 Neural control of the muscular & glandular systems [xxx old 16]	357
The chemical interface between the neural system and the muscular and glandular systems.	
11. Stages 7 Command Generation and the Neuro-affectors	357
The chemical interface between the neural system and the muscular and glandular systems.	
12. The memory elements of the neural system—old 17 xxx	357
XXX The chemical interface between the neural system and the muscular and glandular systems.	
13. The elements of consciousness—old 18	357
XXX The chemical interface between the neural system and the muscular and glandular systems.	
14. Overall Performance from a functional perspective—old 19	357
XXX The chemical interface between the neural system and the muscular and glandular systems.	
15. Disorders of the neural system	357
XXX The chemical interface between the neural system and the muscular and glandular systems.	
[xxx alternate combine following into one chapter on sensory modalities]	
11. The visual modality	357
The first description of the mechanisms and methods used to extract information from the signal streams presented to the CNS, along with the first appearance of “attention” in the	
12. The hearing modality	357
The first description of the mechanisms and methods used to extract information from the signal streams presented to the CNS, along with the first appearance of “attention” in the	
13. The olfactory and gustatory modalities	357
The first description of the mechanisms and methods used to extract information from the signal streams presented to the CNS, along with the first appearance of “attention” in the	
14. Other neural modalities	357
The first description of the mechanisms and methods used to extract information from the signal streams presented to the CNS, along with the first appearance of “attention” in the	

Appendix A: Glossary	453
A glossary providing uniquely precise definitions of many terms, some made available for the first time by the new paradigm.	
Appendix B: A critical review of the Sodium/Potassium Ion Diffusion Theory of the Axon ..	453
Appendix C: The Standard (Electrolytic) Neuron	453
Index	469
